

## LOADING DES MASTER KEY

The disk included with these instructions is to be used to load a new DES (Data Encryption Standard) master key into your site controller. Once the master key has been loaded, you will not be able to use the disk again. Once you have loaded the master key, you will also need a working key which is loaded by the network you are interfacing with via a download or other means. Contact your ASR or credit/debit card network representative for information on loading a working key.

To install the master key:

1. Insert the disk into the A: drive.
2. Sign on to command mode.
3. At the command prompt, type **A:INSTALL** and press ENTER.
4. After the install routine has installed the master key, this message appears:  
  
**Install complete from this disk.**
5. You are then prompted to install files from an additional floppy. This prompt is not applicable for this routine, so type **N** and press ENTER.
6. When the command prompt is displayed and the A: drive light is off, remove the disk.
